

# Multi-stakeholder dialogue and simulated scenario planning to change forest management practices in Alentejo

**Margarida Tomé  
Susana Barreiro**

Pedro Serra Ramos,  
Alexandra Oliveira, João Rua,  
Joana Paulo, Paula Soares,  
Sónia Faias, João Palma,  
Ágata Lam,...

**FINAL CONFERENCE  
12 – 13 OCTOBER 2017  
PARIS, France**

# Pilot Project objective

Increase **WOOD MOBILIZATION** in Alentejo

Traditional wood production species

*Eucalyptus globulus* (9%)

Non-traditional wood production species

*Pinus pinea* (6.5%)

## ***Eucalyptus globulus* and *Pinus pinaster***

Propose measures to increase wood availability through **forest management** using a 'sustainable intensification' concept

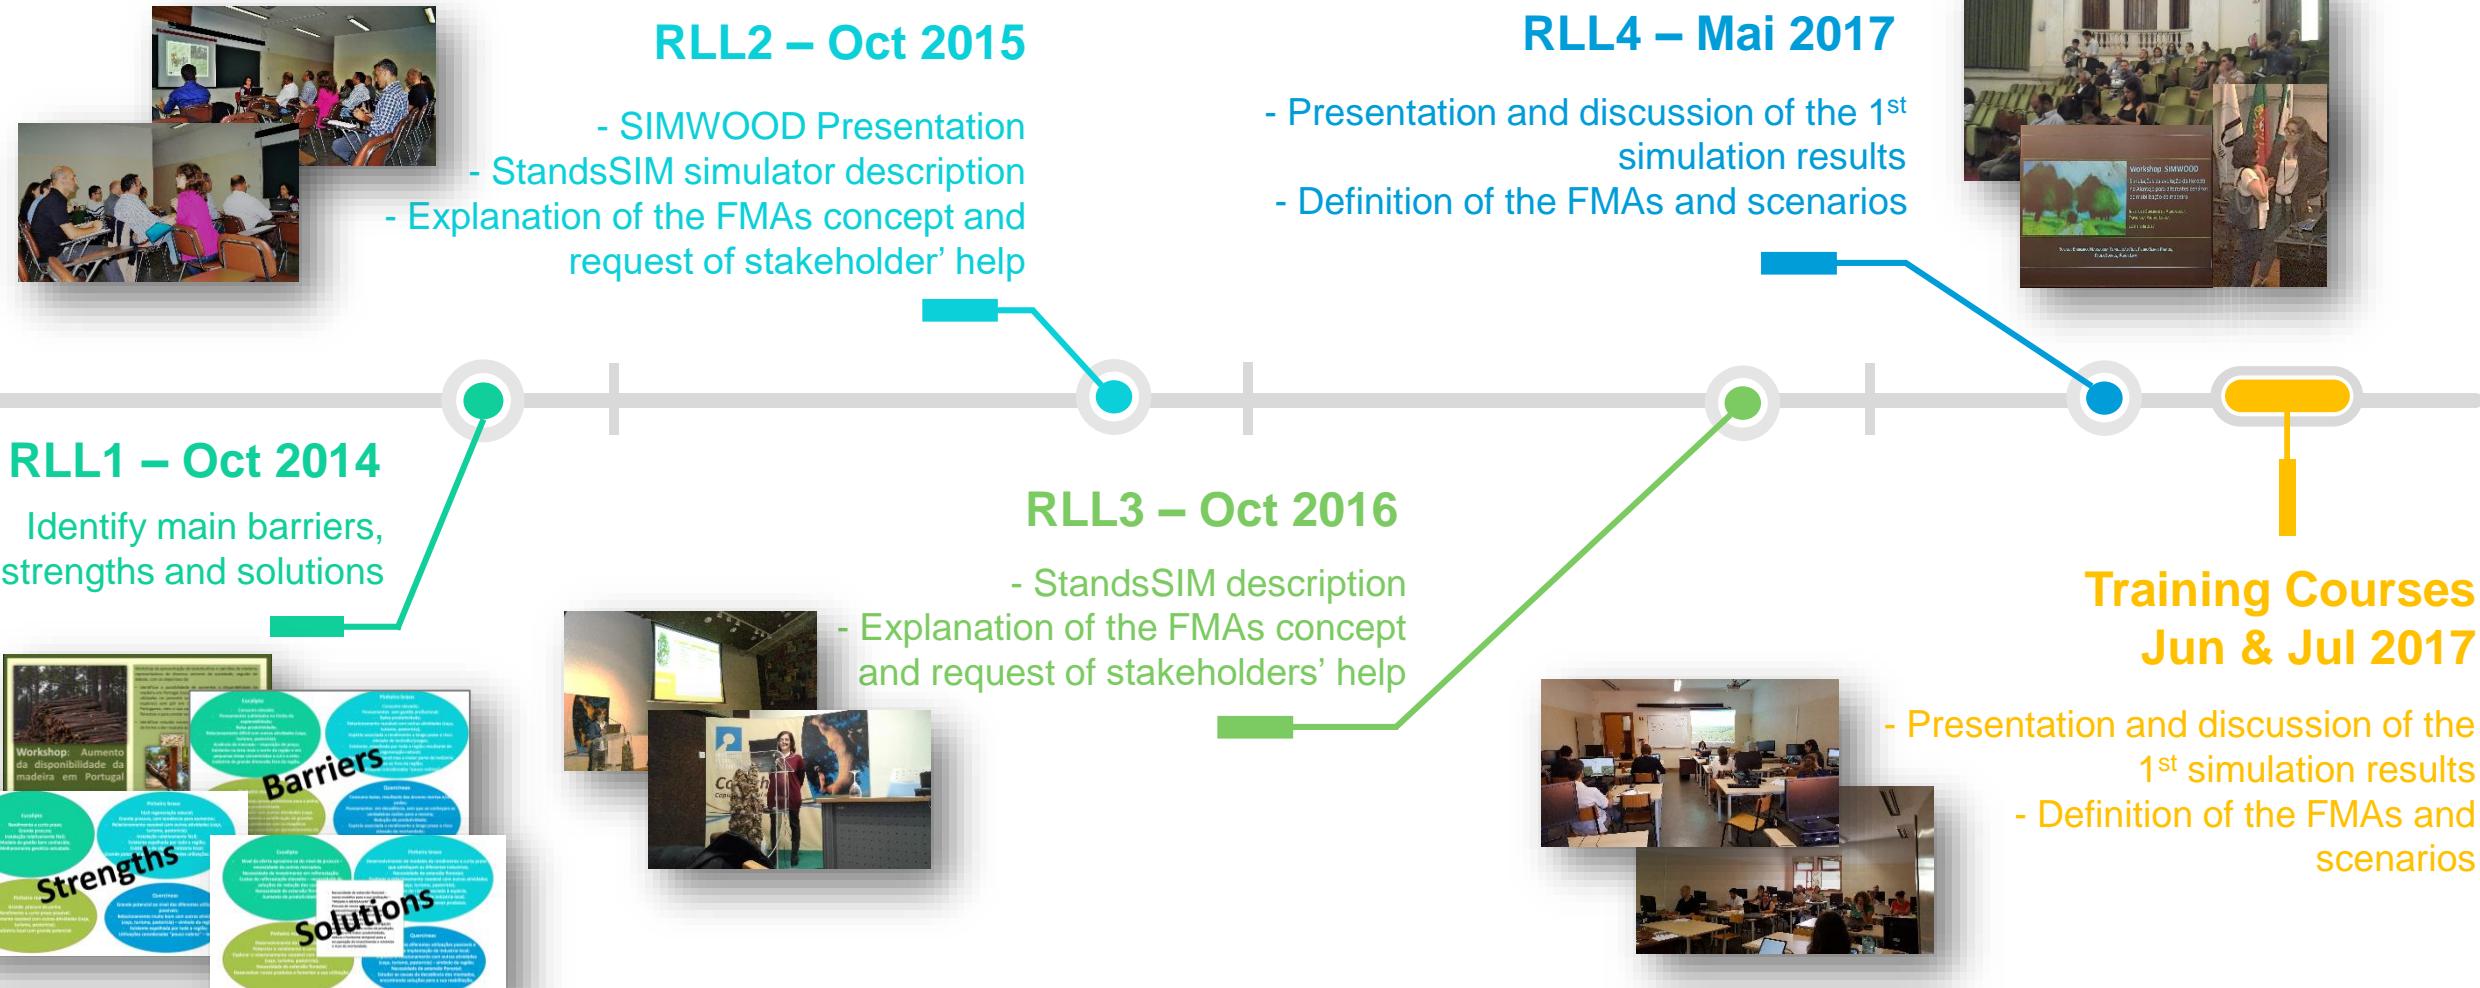

*Quercus suber* (45%)

## ***Quercus suber* and *Pinus pinea***

Assume the use and mobilization of wood from thinning non-traditional wood production species

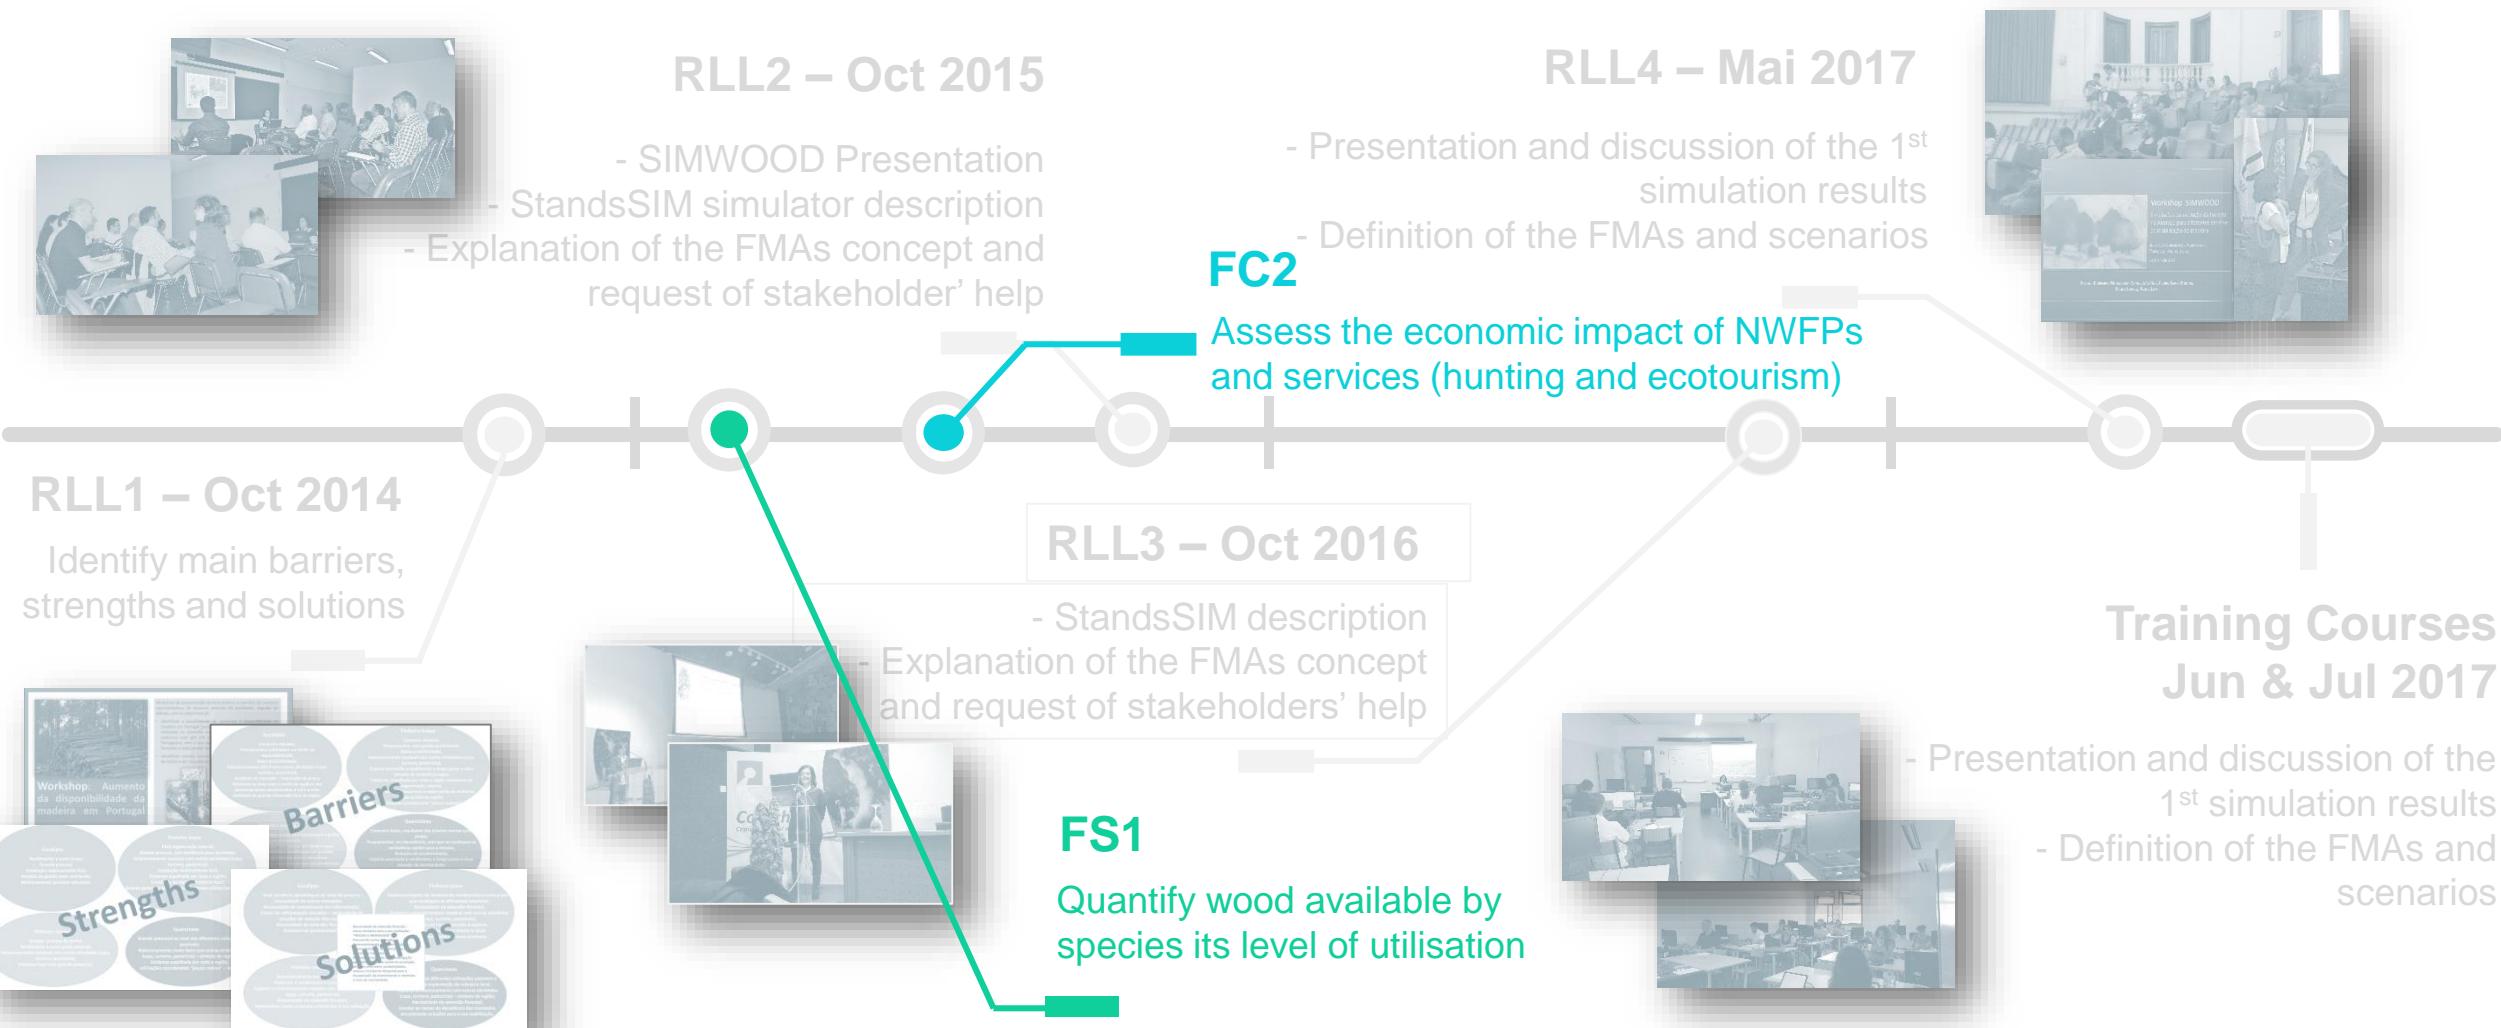

# Pilot Project methodology

## Simulate STAKEHOLDER-DEFINED MANAGEMENT SCENARIOS

# Pilot Project methodology

## Simulate STAKEHOLDER-DEFINED MANAGEMENT SCENARIOS

# Pilot Project methodology

## STAKEHOLDERS TASKFORCE

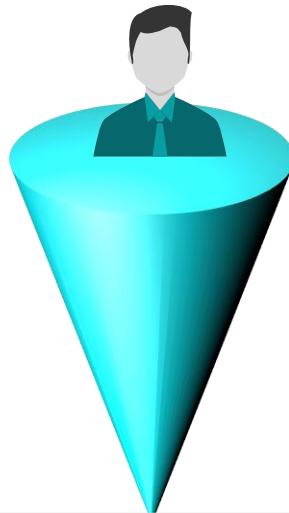

Forest  
Companies

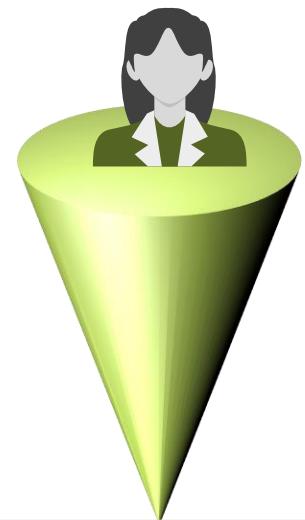

Land Owners  
Associations

Public  
administration

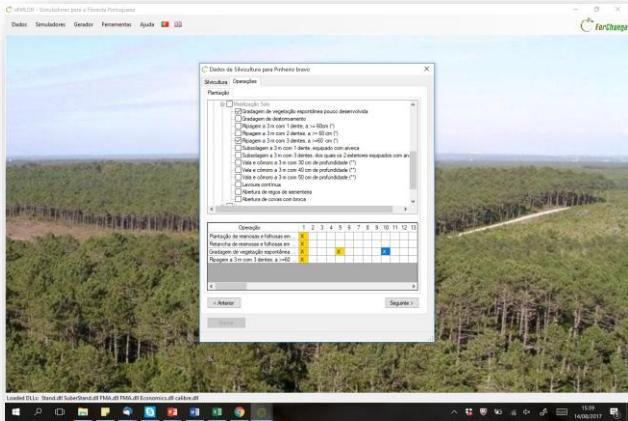

Research

# Pilot Project methodology

<http://www.isa.ulisboa.pt/cef/forchange/fctools/en/home>

Looked into stakeholders opinions

Improved the simulator and the **user-friendly** interface

Prepared the prescriptions, scenarios and run the simulations

Made StandsSIM available on FCTools website (*description of the tool available*)

... To evaluate the impact of the PP on forest managers' attitudes

# Simulations outline

Alentejo  
Pilot Project

StandsSIM.md  
and SUBER  
simulators

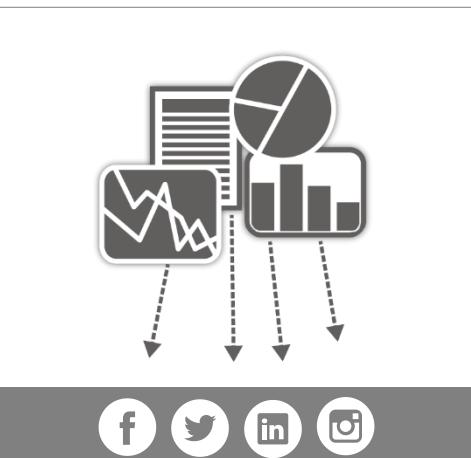

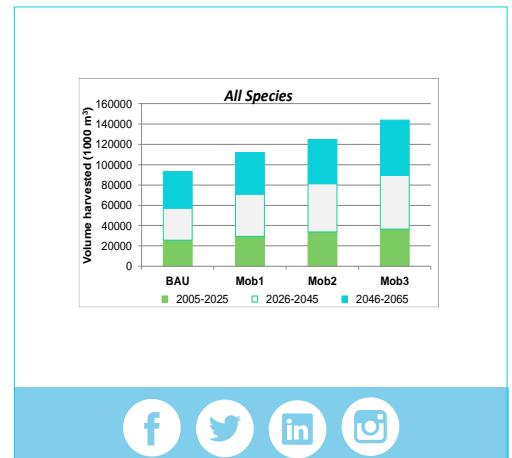

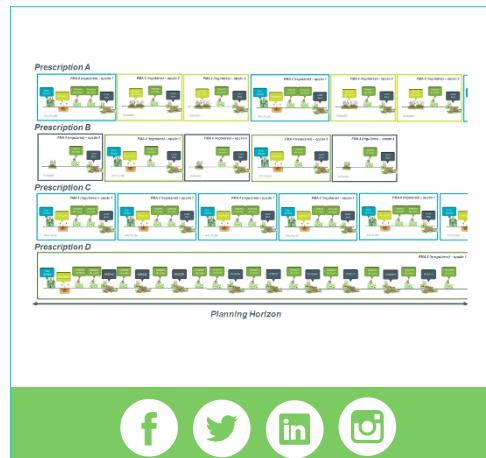

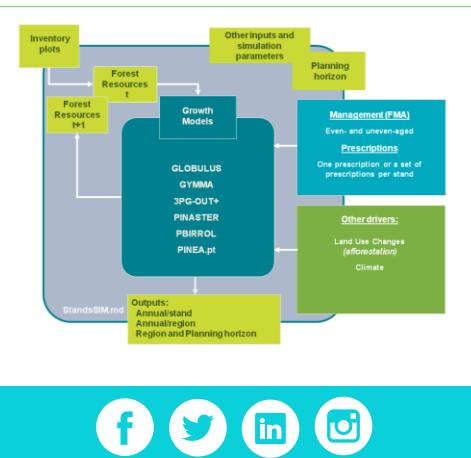

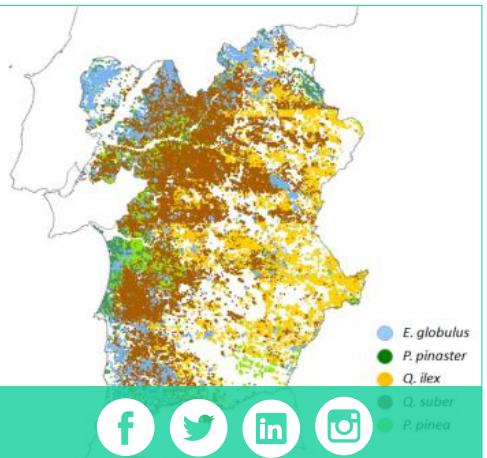

Stakeholders  
and  
management  
scenarios

Simulation  
results

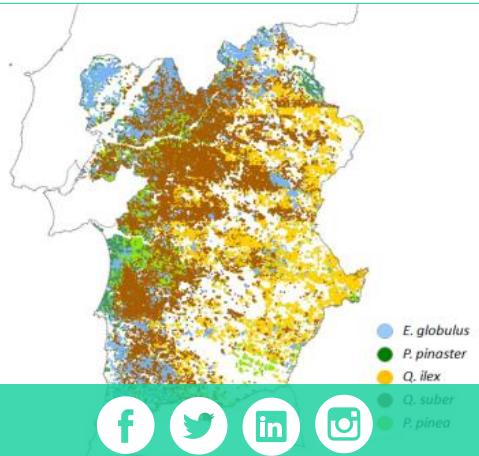

Final remarks  
and  
future steps

## Alentejo Pilot Project

# 01 Alentejo study area

## Alentejo region:

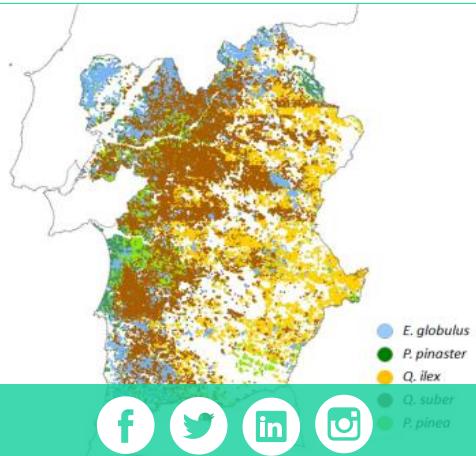

- Reduced population density (*19 habitantes/km<sup>2</sup>*)
- Aged population (*25% older 65 years*)
- Most forest owners are farmers and some do not have technical knowledge
- 97% land is private property

INE, 2011a,b

- Changes due to severe forest fires 2003 and 2005
- 44.74 % forest cover
  - mainly managed as agro-forestry systems
  - *forest cover: 9% E. globulus, 4% P. pinaster*

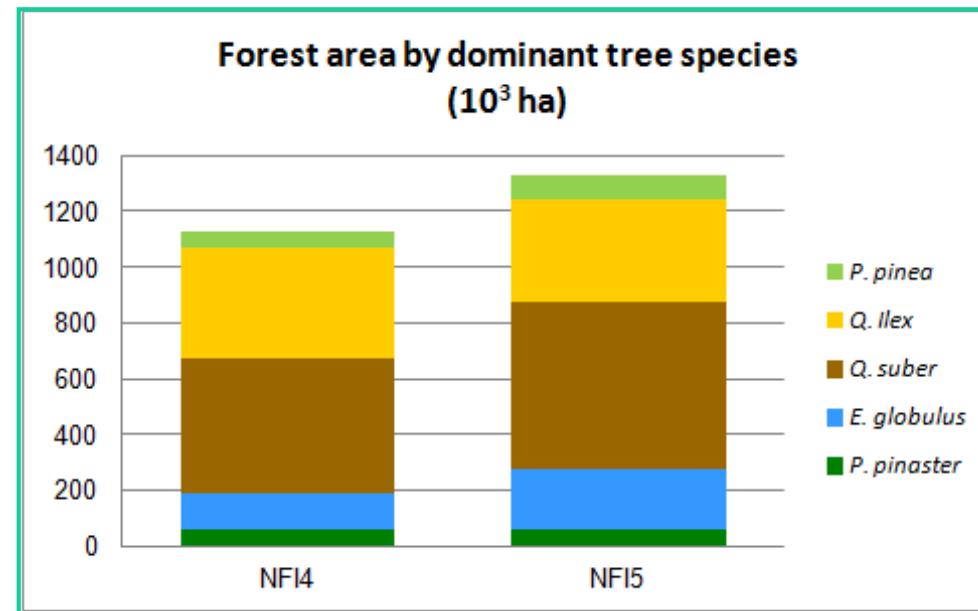

Alentejo  
Pilot Project

# 01 Comparison between NFI4 and NFI5

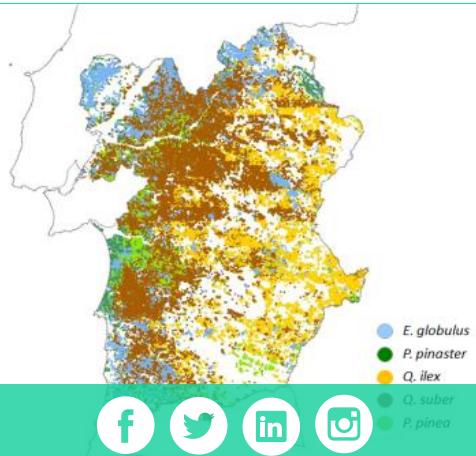

NFI4 (1995-1997)  
NFI5 (2005-2006)

Increase in **forest area** (*Q. suber*, *E. globulus*, *P. pinea*)

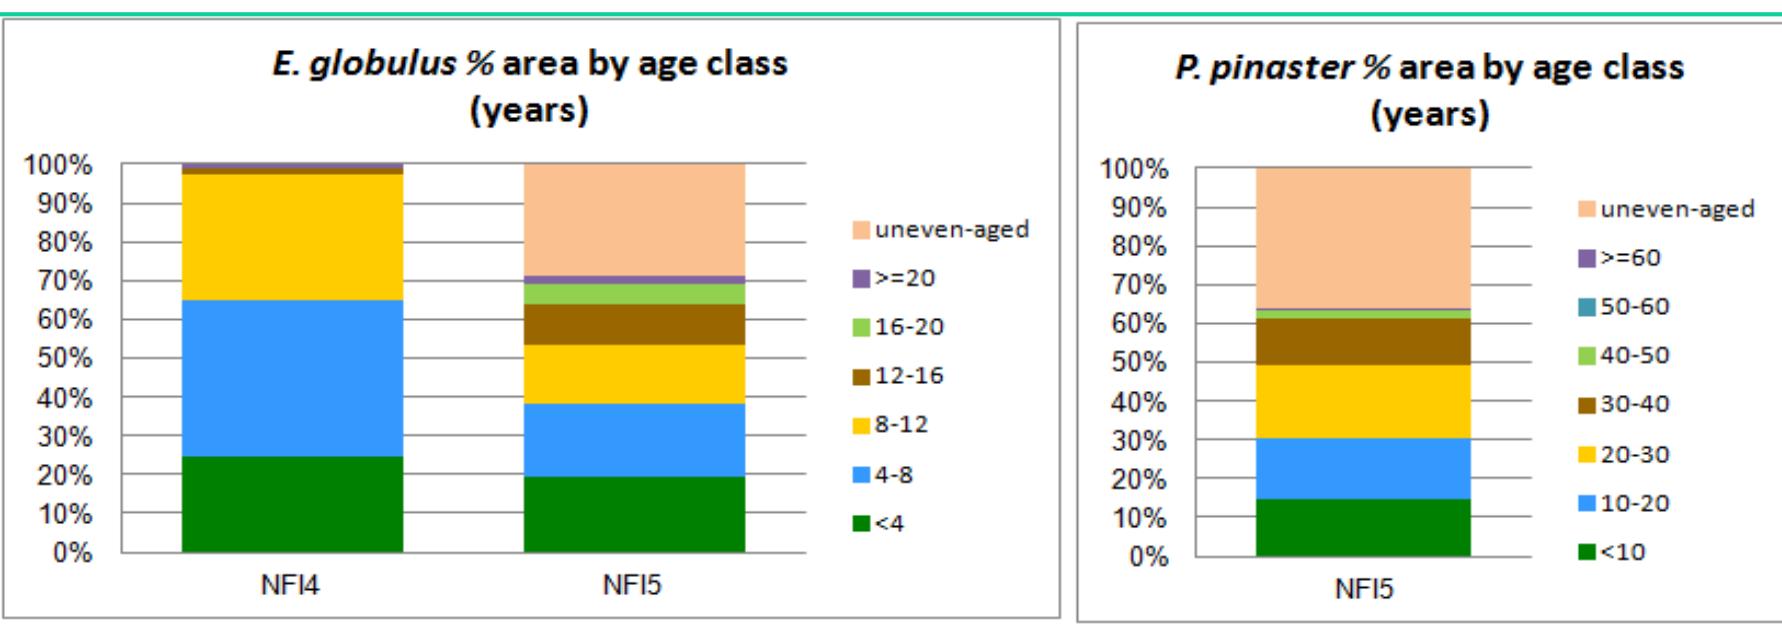

## Alentejo Pilot Project

# 01 Comparison between NFI4 and NFI5

NFI4 (1995-1997)  
NFI5 (2005-2006)

Increase in the proportion of **uneven-aged** and old stands (*older than 16*)

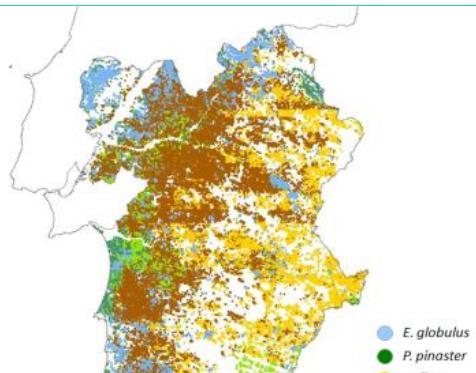

# 01 Comparison between NFI4 and NFI5

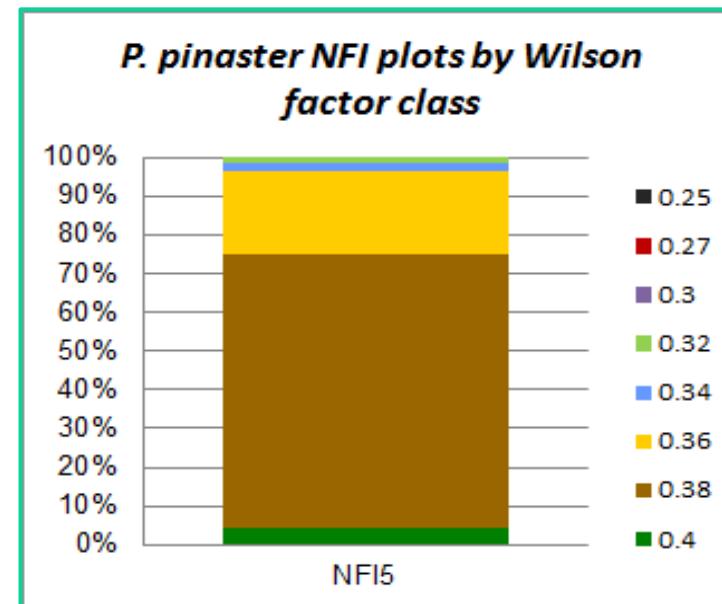

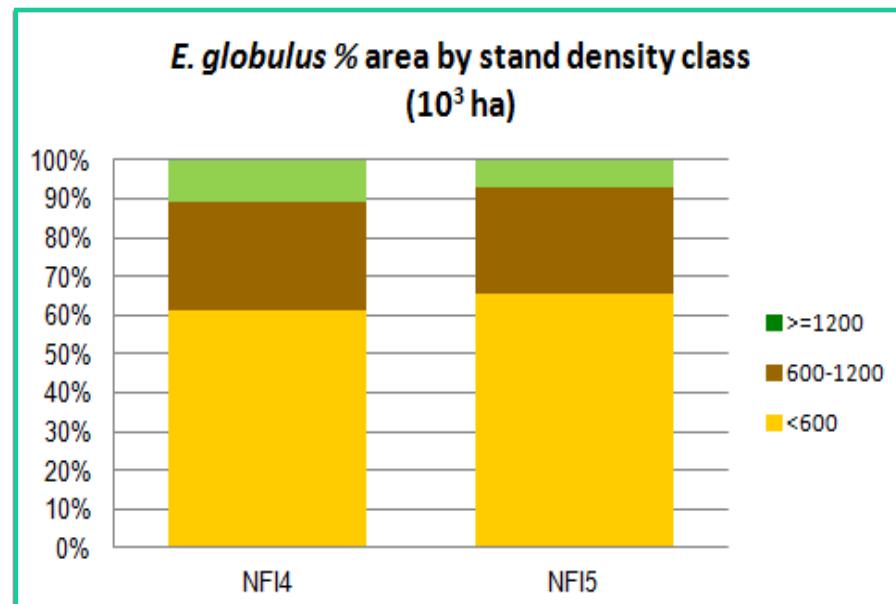

NFI4 (1995-1997)  
NFI5 (2005-2006)

Alentejo  
Pilot Project

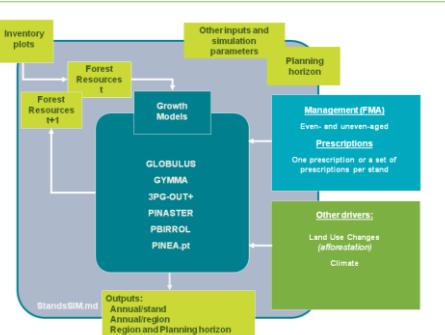

Slight increase in the proportion of **under-stocked stands** (*trees dbh < 5 cm disregarded*)

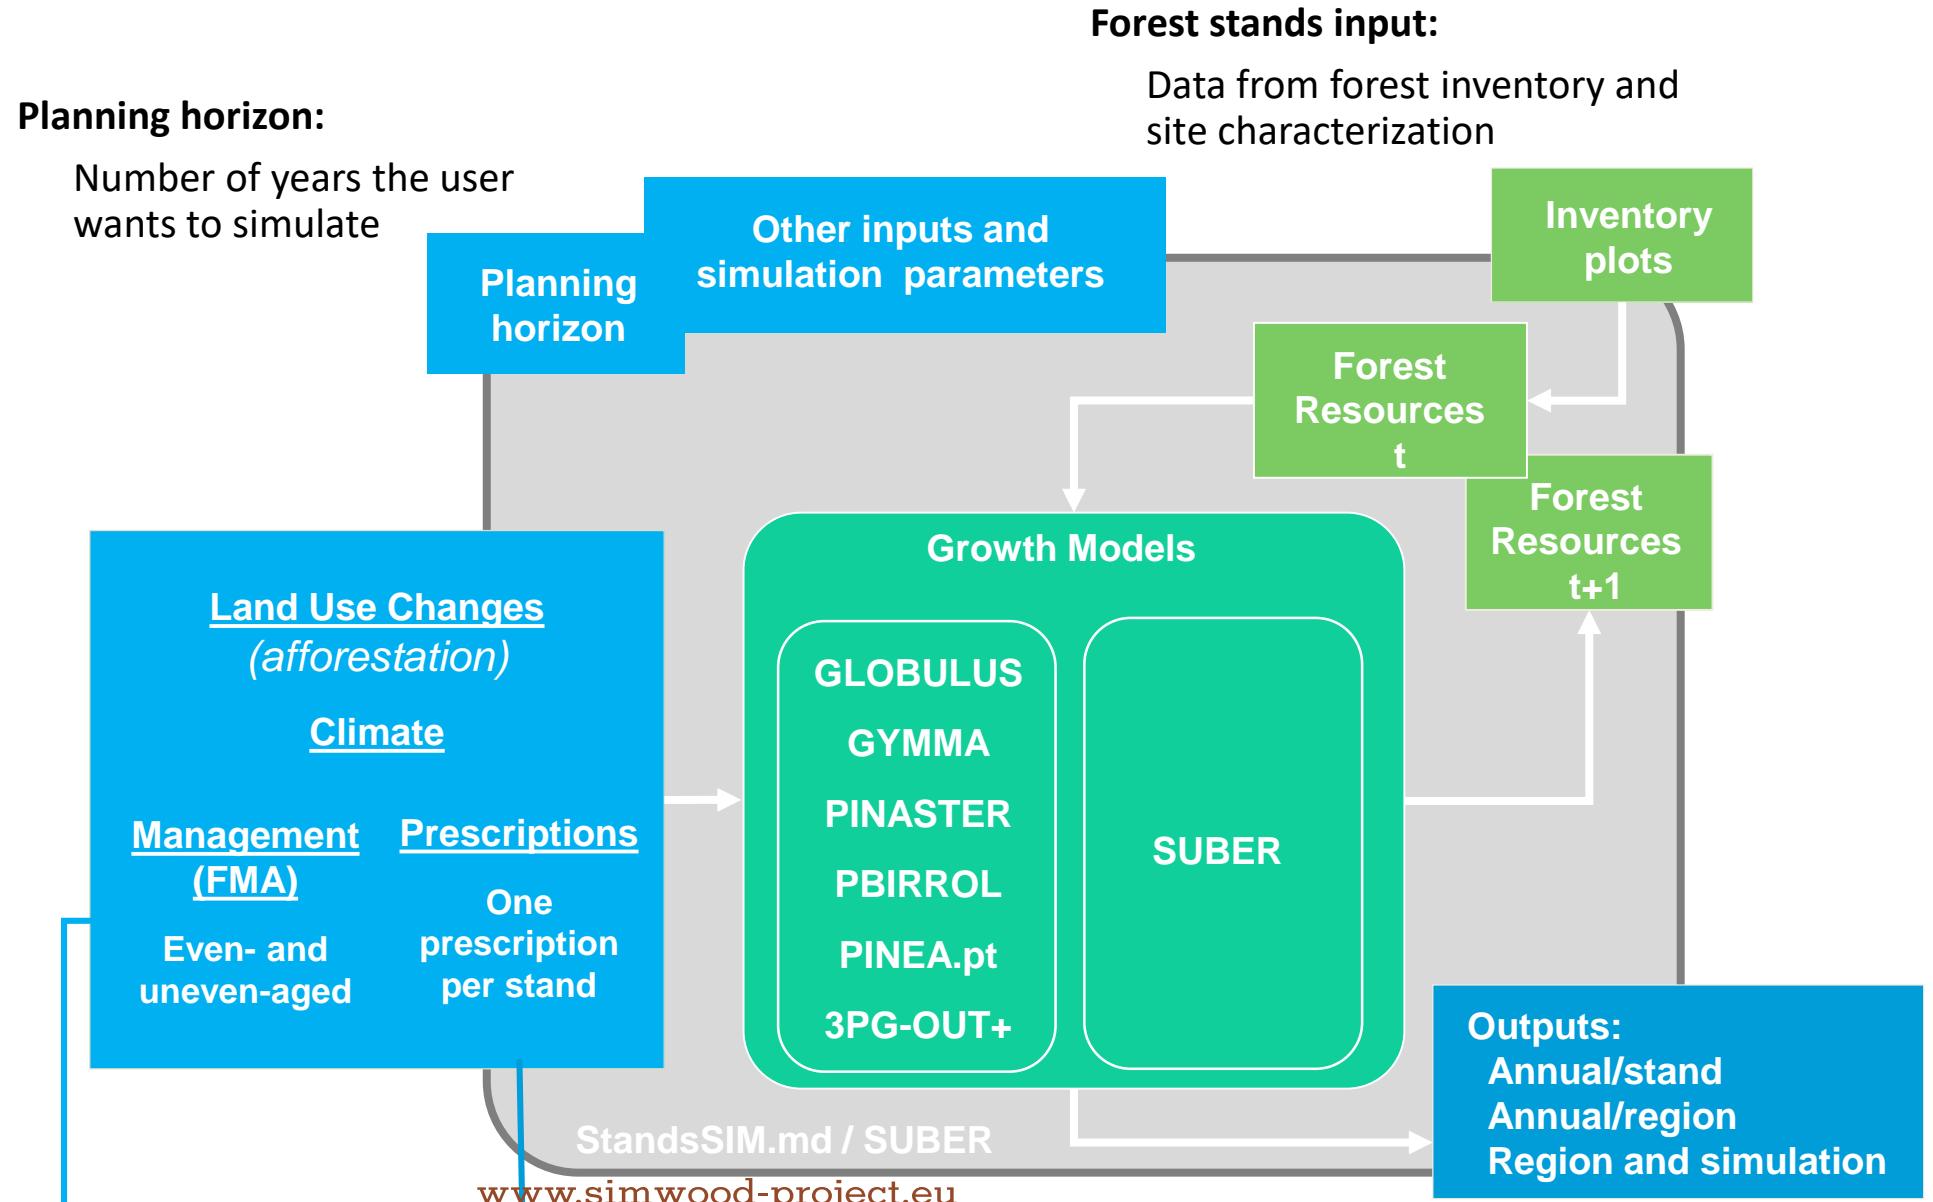

## 02 How StandsSIM.md and SUBER work

StandsSIM.md  
and SUBER  
simulators

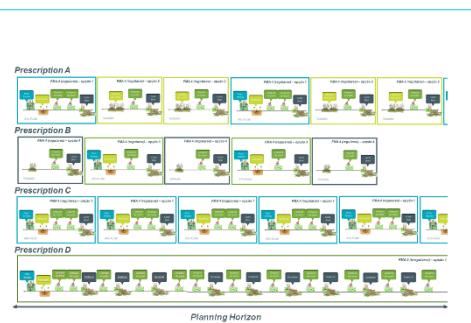

### Planning horizon:

Number of years the user wants to simulate

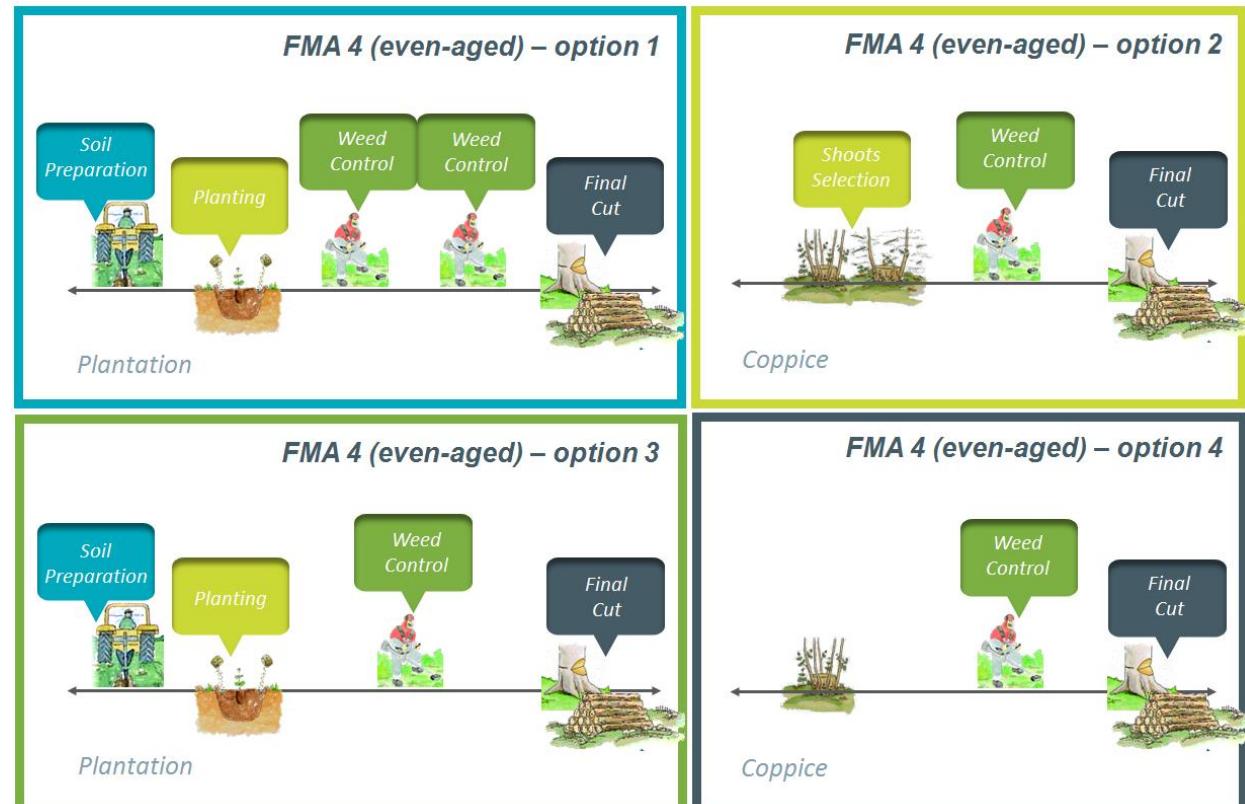

## 03 StandsSIM.md and SUBER management inputs

  
Stakeholders  
and  
management  
scenarios

- Forest management approach (**FMA**):

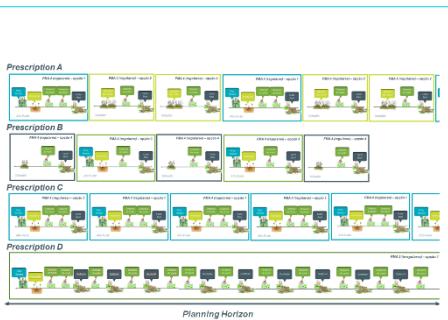

Set of silvicultural operations from stand regeneration until final harvest

## 03 StandsSIM.md and SUBER management inputs

  
Stakeholders  
and  
management  
scenarios

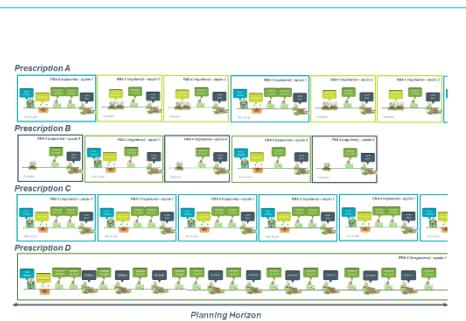

- Forest management approach (**FMA**):  
Set of silvicultural operations from stand regeneration until final harvest
- Prescription  
Sequence of FMAs throughout the planning horizon

## 03 StandsSIM.md and SUBER management inputs

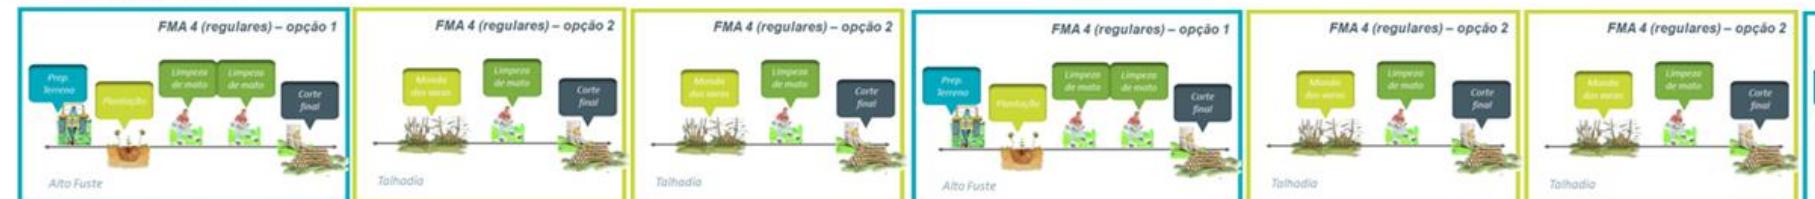

# Stakeholders and management scenarios

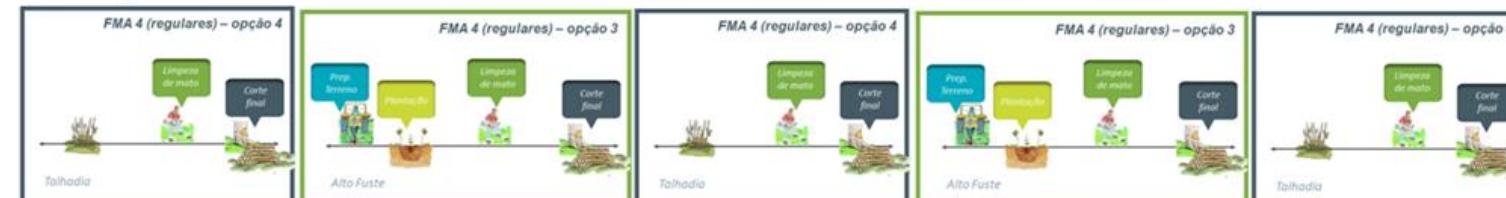

- Forest management approach (**FMA**):

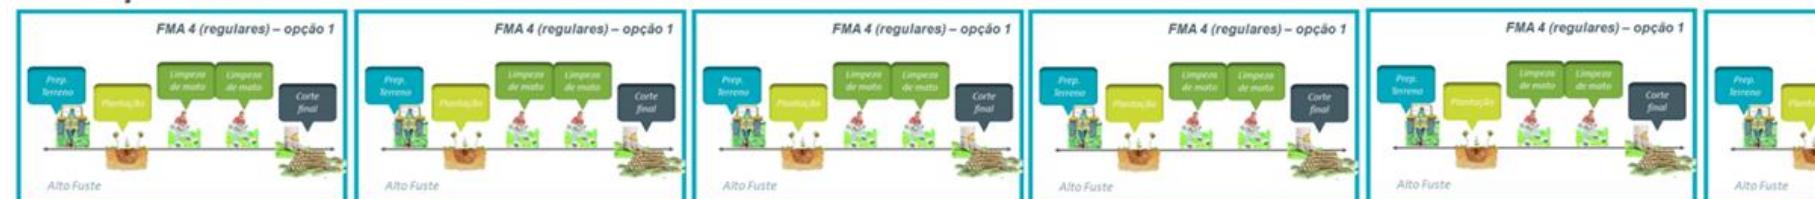

### **Prescription A**

### **Prescription B**

## Prescription C

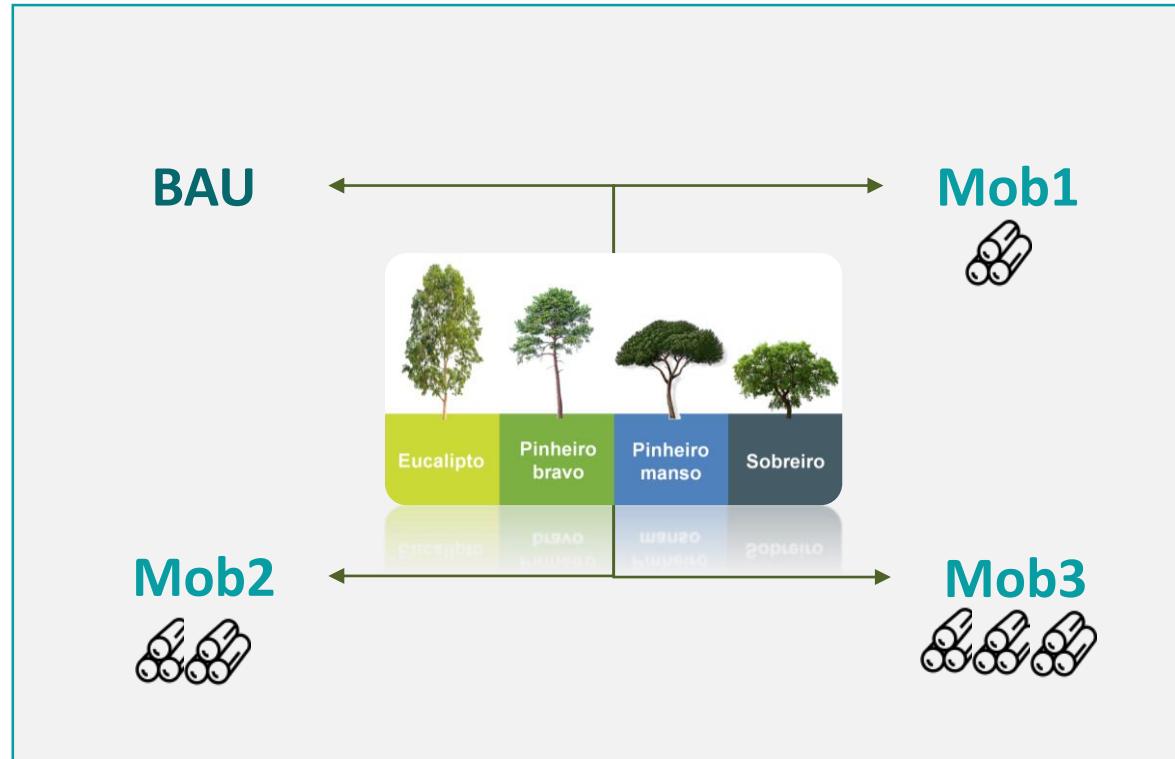

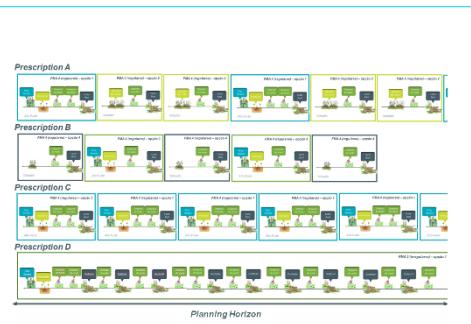

*Prescription D*

## 03 Scenarios' definition

 Stakeholders  
and  
management  
scenarios

**BAU**

Business as usual  
scenario reflecting the  
current forest  
management

**Mob's**

Scenarios reflecting  
increasing levels of  
management  
intensification

Scenario **drivers** were selected  
based on the NFI data analysis  
and discussed with stakeholders helped defining FMAs, prescriptions  
and the total amount of each driver  
for characterizing the 4 scenarios

## 03 Scenarios' definition

Stakeholders  
and  
management  
scenarios

**BAU**

Business as usual  
scenario reflecting the  
current forest  
management

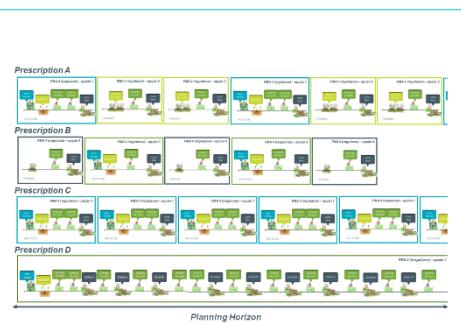

**Mob's**

Scenarios reflecting  
increasing levels of  
management  
intensification

Scenario **drivers** were selected based on the NFI data analysis and discussed with stakeholders helped defining FMAs, prescriptions and the total amount of each driver for characterizing the 4 scenarios

# 03 Scenarios' definition

 Stakeholders and management scenarios

A set of different prescriptions (*one per plot*) was assigned to each scenario

## THE DRIVERS

Increase area of new plantations

Relocate less productive stands

Convert to even-aged stands

Convert to well-stocked stands

Re-plant old coppices (>3<sup>rd</sup> rot)

Increase harvest age

## THE SIMULATION

**Planning horizon:** 60 years (from 2005 to 2065 by 20-yrs period)

**Forest simulators:**

**StandsSIM**

**SUBER**

**Growth models:**

**GLOBULUS3  
GYMMA**

**PINASTER  
PBIRROL**

**PINEA.pt**

**SUBER**

**Nr Stands simulated:**

*E. globulus*  
(330)

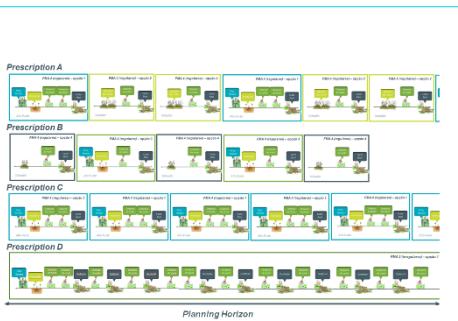

*P. pinaster*  
(189)

*P. pinea*  
(153)

*Q. suber*  
(1142)

## 03 Scenarios' definition (*Example for E.globulus*)

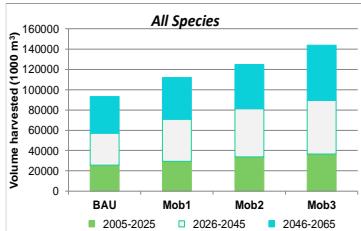

### Stakeholders and management scenarios

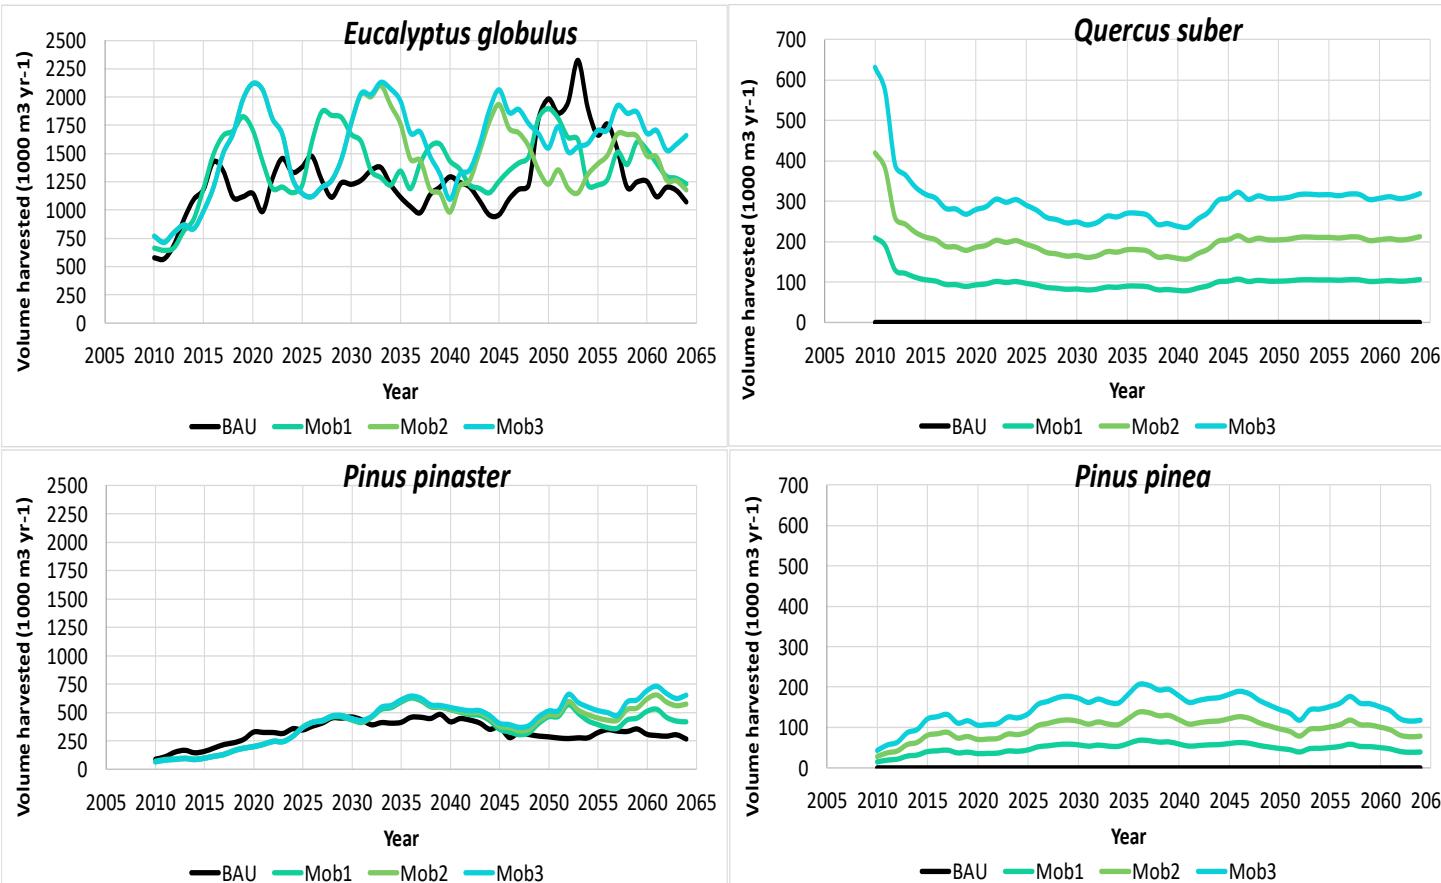

Simulation years	2005-2065		2005-2065		2005-2065		2005-2065							
Mobilization drivers	BAU		Mob1		Mob2		Mob3							
New plantations (ha yr <sup>-1</sup> )	0	0	0	0	0	0	0	0						
Relocated plantations (ha yr <sup>-1</sup> )	0%		0%		0%		15% (stands with S <14)							
Replant rotations >3	Information on stand structure, stand composition and S were used to set probabilities for each stand being managed over the 3 <sup>rd</sup> rotation and a different percentage of stands going over the 3 <sup>rd</sup> rotation was defined for each scenario													
	30% (4 <sup>th</sup> , 5 <sup>th</sup> rotations)		20% (4 <sup>th</sup> , 5 <sup>th</sup> rotations)		10% (4 <sup>th</sup> rotation)		0% (3 <sup>rd</sup> rotation)							
Convert uneven- to even-aged stands	No conversion to even-aged stands considered	Conversion to even-aged stands is considered: priority is given to stands over 200 m <sup>3</sup> , the remaining stands are randomly selected for harvest throughout the planning horizon												
Convert un-stocked to well-stocked stands	No conversion to well-stocked stands considered.  (Replanting after the maximum rotation with 1100 trees ha <sup>-1</sup> )	1) Stocking levels were analysed based on information on site index and stand density: stands considered under-stocked if S>18 and N<800 or if S<10 and N<400 2) Conversion applied to even- and uneven-aged stands 3) Replanting immediately after harvest regardless of coppice rotation. Harvest takes place when harvest age is met (even-aged) or randomly throughout the planning horizon (uneven-aged) 4) Planting densities vary according to S class: <table border="1"> <tr> <td>[ 0-18[ 1100 trees ha<sup>-1</sup></td> <td>[ 0-18[ 1100 trees ha<sup>-1</sup></td> </tr> <tr> <td>[18-22[ 1250 trees ha<sup>-1</sup></td> <td>[18-22[ 1250 trees ha<sup>-1</sup></td> </tr> <tr> <td>[22-26[ 1250 trees ha<sup>-1</sup></td> <td>[22-26[ 1400 trees ha<sup>-1</sup></td> </tr> </table>							[ 0-18[ 1100 trees ha <sup>-1</sup>	[ 0-18[ 1100 trees ha <sup>-1</sup>	[18-22[ 1250 trees ha <sup>-1</sup>	[18-22[ 1250 trees ha <sup>-1</sup>	[22-26[ 1250 trees ha <sup>-1</sup>	[22-26[ 1400 trees ha <sup>-1</sup>
[ 0-18[ 1100 trees ha <sup>-1</sup>	[ 0-18[ 1100 trees ha <sup>-1</sup>													
[18-22[ 1250 trees ha <sup>-1</sup>	[18-22[ 1250 trees ha <sup>-1</sup>													
[22-26[ 1250 trees ha <sup>-1</sup>	[22-26[ 1400 trees ha <sup>-1</sup>													
Increase rotation age	[ 0-10[: 12 yrs [10-14[: 11 yrs [14-18[: 10 yrs [18-22[: 9 yrs [22-26[: 8 yrs	[ 0-10[: 14 yrs [10-14[: 13 yrs [14-18[: 12 yrs [18-22[: 11 yrs [22-26[: 10 yrs	Uneven-aged stands with volume >200 m <sup>3</sup> are harvested while those with lower volumes are randomly selected for conversion to even-aged throughout the planning horizon; whereas for even-aged stands harvest ages vary according to S class: <table border="1"> <tr> <td>[ 0-10[: 16 yrs</td> </tr> <tr> <td>[10-14[: 15 yrs</td> </tr> <tr> <td>[14-18[: 14 yrs</td> </tr> <tr> <td>[18-22[: 13 yrs</td> </tr> <tr> <td>[22-26[: 12 yrs</td> </tr> </table>						[ 0-10[: 16 yrs	[10-14[: 15 yrs	[14-18[: 14 yrs	[18-22[: 13 yrs	[22-26[: 12 yrs	
[ 0-10[: 16 yrs														
[10-14[: 15 yrs														
[14-18[: 14 yrs														
[18-22[: 13 yrs														
[22-26[: 12 yrs														

# 04 Simulation results

## Simulation results

### Harvested volume (5 yrs moving averages)

#### Volume harvested:

*E. globulus* = final harvest

*P. pinaster* = final harvest + thinning

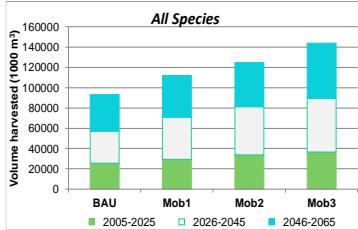

*Q. suber, P. pinea* = thinning

- Substantial contribution of **eucalyptus** for increasing wood availability when compared to the other species

- Increase in wood availability from **BAU** towards **Mob3**

# 04 Simulation results

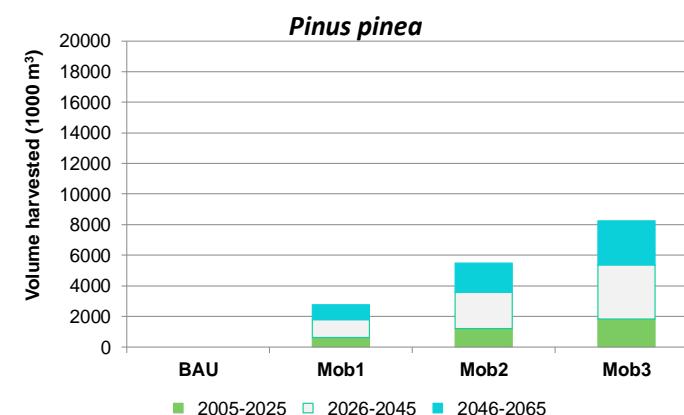

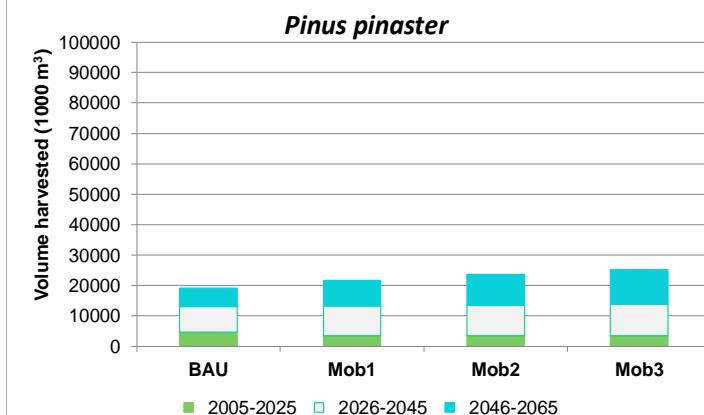

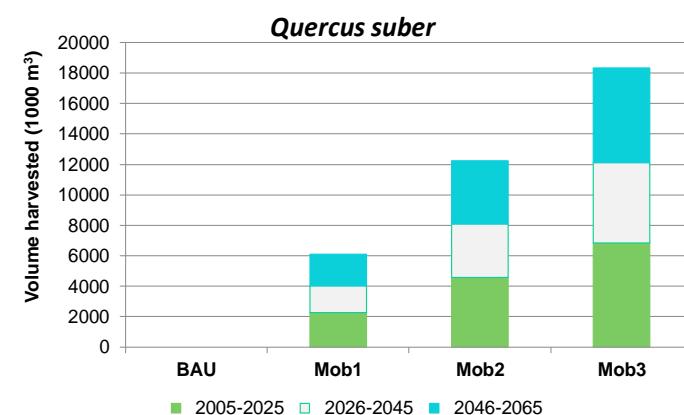

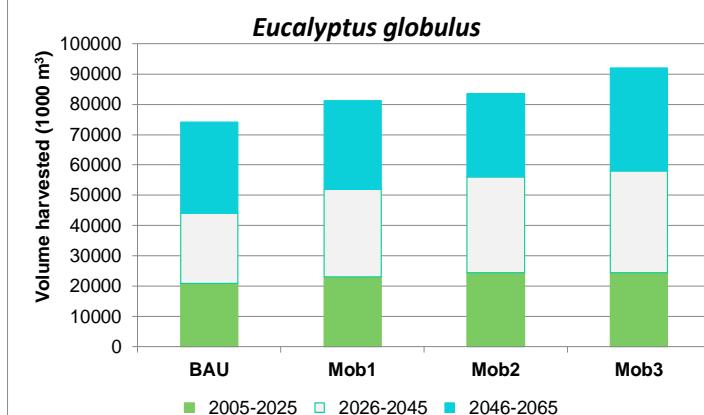

## Simulation results

## Harvested volume by 20 yrs period

% of thinned volume used:

0%    25%    50%    75%

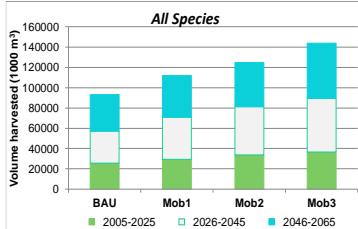

**Non-traditional wood production species** - if considered, an increase over 18 million m<sup>3</sup> could be expected in Mob3

### *E. globulus*

In the 1<sup>st</sup> 20-yrs no substantial differences among scenarios were detected, becoming evident over the next years

# 04 Simulation results

## Simulation results

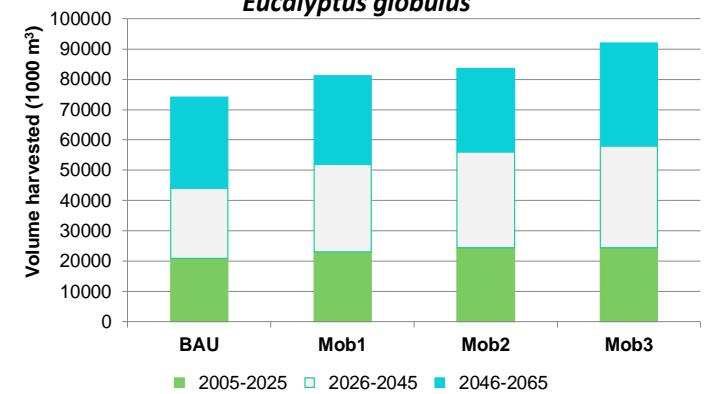

## Harvested volume by 20 yrs period

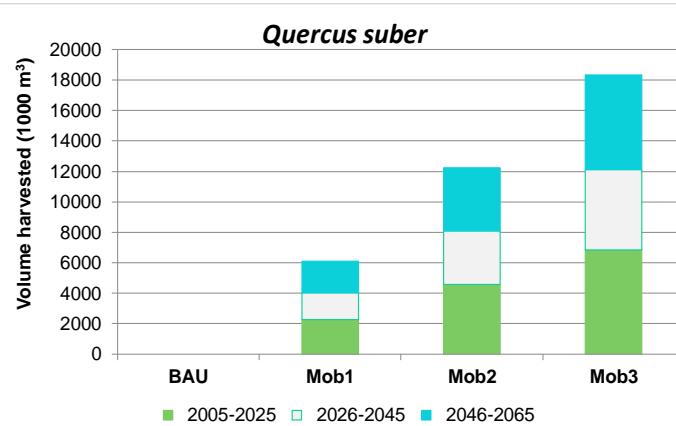

% of thinned volume used:

0%    25%    50%    75%

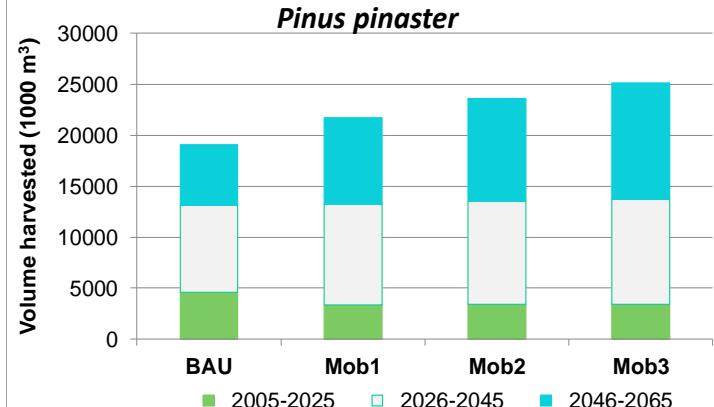

*Eucalyptus globulus*

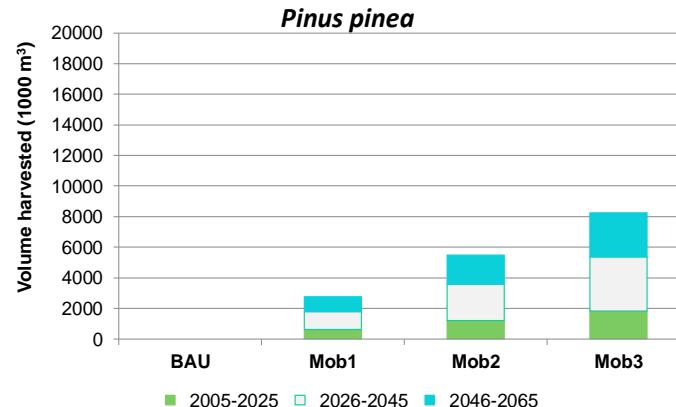

*Quercus suber*

*Pinus pinaster*

*Pinus pinea*

### *E. globulus*

In the 1<sup>st</sup> 20-yrs no substantial differences among scenarios were detected, becoming evident over the next years

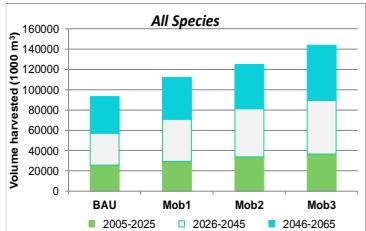

### *P. pinaster*

The BAU scenario has higher wood availability in the short term (all stands harvested at 35 yrs), but less wood available in the long run

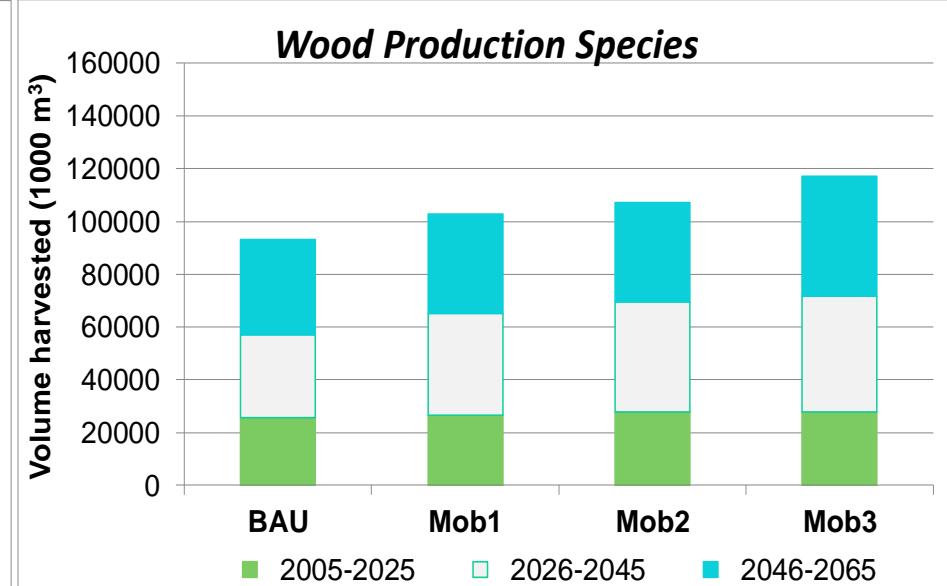

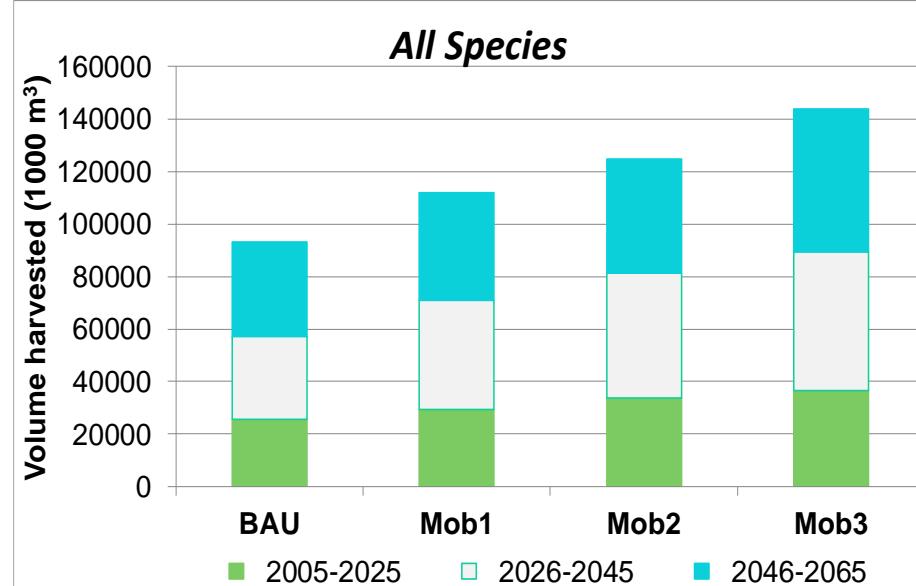

**Non-traditional wood production species** - if considered, an increase over 18 million m<sup>3</sup> could be expected in Mob3

# 04 Simulation results

## Simulation results

## Harvested volume

These results disregard the occurrence of hazards.  
Extrapolations for long-term analysis should be carefully done.

# 05 Final remarks and future steps

Final  
remarks and  
future steps

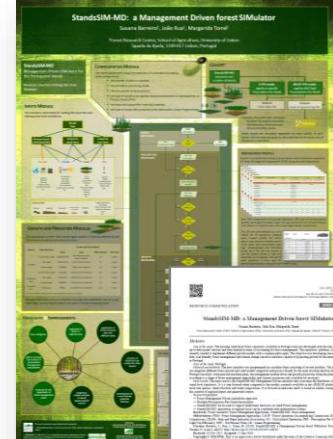

## CONCLUSIONS

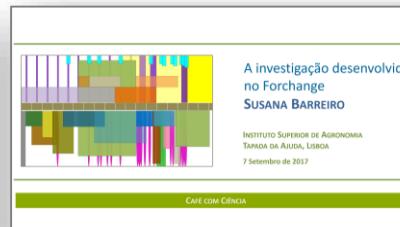

**StandsSIM.md/SUBER** were able to **simulate** the impact of different **FMA/prescriptions**, therefore can be used by forest managers in **decision making**

## DISSEMINATION

### FORESTERRA ERA-NET FINAL CONFERENCE

### CAFÉ COM CIÊNCIA, FOREST RESEARCH CENTRE

### CASO DE ESTUDO SOBRE OS INCÊNDIOS DE GÓIS, FREGUESIA DE ALVARES

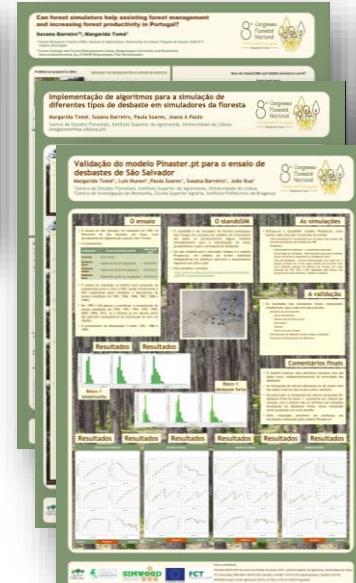

### IUFRO 125TH ANNIVERSARY CONGRESS 2017

Host a PhD student running simulations for Mediterranean plantations who wants to use StandsSIM.md and test the Stakeholder-defined FMAs

### 8º CONGRESSO FLORESTAL NACIONAL

### FCTools WEBPAGE

Project application to produce a web-version of the stand level StandsSIM.md for users (certification purposes)

# THANK YOU!
